

# Kinematic mapping - recent results and applications

Manfred Husty

Institute for Basic Sciences in Engineering, Unit for Geometry and CAD, University of Innsbruck, Austria

POLYNOMIALS KINEMATICS AND ROBOTICS

University of Notre Dame, June 2017

# Overview

## Kinematic mapping

- Geometry of the Study quadric
- Dual Quaternion interpretation - Clifford Algebra
- Image space transformations

## Constraint Varieties

- Derivation of constraint equations
- Global Singularities
- Operation Modes - Ideal Decomposition

## Path Planning and Cable Robots

- Path planning in kinematic image space
- Cable driven parallel manipulators

Euclidean displacement:

$$\gamma: \mathbb{R}^3 \rightarrow \mathbb{R}^3, \quad \mathbf{x} \mapsto \mathbf{Ax} + \mathbf{a} \quad (1)$$

$\mathbf{A}$  proper orthogonal  $3 \times 3$  matrix,  $\mathbf{a} \in \mathbb{R}^3$  ... vector

group of Euclidean displacements: SE(3)

$$\begin{bmatrix} 1 \\ \mathbf{x} \end{bmatrix} \mapsto \begin{bmatrix} 1 & \mathbf{o}^T \\ \mathbf{a} & \mathbf{A} \end{bmatrix} \cdot \begin{bmatrix} 1 \\ \mathbf{x} \end{bmatrix}. \quad (2)$$

Study's kinematic mapping  $\varkappa$ :

$$\varkappa : \alpha \in \text{SE}(3) \mapsto \mathbf{x} \in \mathbb{P}^7$$

Study's kinematic mapping  $\varkappa$ :

$$\varkappa : \alpha \in \text{SE}(3) \mapsto \mathbf{x} \in \mathbb{P}^7$$

pre-image of  $\mathbf{x}$  is the displacement  $\alpha$

$$\frac{1}{\Delta} \begin{bmatrix} \Delta & 0 & 0 & 0 \\ p & x_0^2 + x_1^2 - x_2^2 - x_3^2 & 2(x_1x_2 - x_0x_3) & 2(x_1x_3 + x_0x_2) \\ q & 2(x_1x_2 + x_0x_3) & x_0^2 - x_1^2 + x_2^2 - x_3^2 & 2(x_2x_3 - x_0x_1) \\ r & 2(x_1x_3 - x_0x_2) & 2(x_2x_3 + x_0x_1) & x_0^2 - x_1^2 - x_2^2 + x_3^2 \end{bmatrix} \quad (3)$$

$$p = 2(-x_0y_1 + x_1y_0 - x_2y_3 + x_3y_2),$$

$$q = 2(-x_0y_2 + x_1y_3 + x_2y_0 - x_3y_1),$$

$$r = 2(-x_0y_3 - x_1y_2 + x_2y_1 + x_3y_0),$$

$$\Delta = x_0^2 + x_1^2 + x_2^2 + x_3^2.$$

Study's kinematic mapping  $\varkappa$ :

$$\varkappa : \alpha \in SE(3) \mapsto \mathbf{x} \in \mathbb{P}^7$$

pre-image of  $\mathbf{x}$  is the displacement  $\alpha$

$$\frac{1}{\Delta} \begin{bmatrix} \Delta & 0 & 0 & 0 \\ p & x_0^2 + x_1^2 - x_2^2 - x_3^2 & 2(x_1 x_2 - x_0 x_3) & 2(x_1 x_3 + x_0 x_2) \\ q & 2(x_1 x_2 + x_0 x_3) & x_0^2 - x_1^2 + x_2^2 - x_3^2 & 2(x_2 x_3 - x_0 x_1) \\ r & 2(x_1 x_3 - x_0 x_2) & 2(x_2 x_3 + x_0 x_1) & x_0^2 - x_1^2 - x_2^2 + x_3^2 \end{bmatrix} \quad (3)$$

$$p = 2(-x_0 y_1 + x_1 y_0 - x_2 y_3 + x_3 y_2),$$

$$q = 2(-x_0 y_2 + x_1 y_3 + x_2 y_0 - x_3 y_1), \quad (4)$$

$$r = 2(-x_0 y_3 - x_1 y_2 + x_2 y_1 + x_3 y_0),$$

$$\Delta = x_0^2 + x_1^2 + x_2^2 + x_3^2.$$

$$S_6^2 : x_0 y_0 + x_1 y_1 + x_2 y_2 + x_3 y_3 = 0, \quad x_i \text{ not all } 0 \quad (5)$$

$[x_0 : \dots : y_3]^T$  Study parameters = parametrization of  $SE(3)$  with dual quaternions

How do we get the Study parameters when a proper orthogonal matrix  $\mathbf{A} = [a_{ij}]$  and the translation vector  $\mathbf{a} = [a_k]^T$  are given?

How do we get the Study parameters when a proper orthogonal matrix  $\mathbf{A} = [a_{ij}]$  and the translation vector  $\mathbf{a} = [a_k]^T$  are given?

Cayley map, not singularity free ( $180^\circ$ )

How do we get the Study parameters when a proper orthogonal matrix  $\mathbf{A} = [a_{ij}]$  and the translation vector  $\mathbf{a} = [a_k]^T$  are given?

Cayley map, not singularity free ( $180^\circ$ )

Rotation part:

$$\begin{aligned}x_0 : x_1 : x_2 : x_3 &= 1 + a_{11} + a_{22} + a_{33} : a_{32} - a_{23} : a_{13} - a_{31} : a_{21} - a_{12} \\ &= a_{32} - a_{23} : 1 + a_{11} - a_{22} - a_{33} : a_{12} + a_{21} : a_{31} + a_{13} \\ &= a_{13} - a_{31} : a_{12} + a_{21} : 1 - a_{11} + a_{22} - a_{33} : a_{23} + a_{32} \\ &= a_{21} - a_{12} : a_{31} + a_{13} : a_{23} - a_{32} : 1 - a_{11} - a_{22} + a_{33}\end{aligned} \quad (6)$$

Translation part:

$$\begin{aligned}2y_0 &= a_1 x_1 + a_2 x_2 + a_3 x_3, & 2y_1 &= -a_1 x_0 + a_3 x_2 - a_2 x_3, \\ 2y_2 &= -a_2 x_0 - a_3 x_1 + a_1 x_3, & 2y_3 &= -a_3 x_0 + a_2 x_1 - a_1 x_2.\end{aligned} \quad (7)$$

and  $\mathbf{O}$  is the four by four zero matrix.

- ▶  $\mathbf{T}_m$  and  $\mathbf{T}_f$  commute
- ▶  $\mathbf{T}_m$  and  $\mathbf{T}_f$  induce transformations of  $P^7$  that fix  $S_6^2$ , the exceptional generator  $\mathcal{E}$  the exceptional quadric  $\mathcal{Y}$  the Null-cone  $\mathcal{N}$  and the pencil  $\mathcal{D} = \lambda S_6^2 + \mu \mathcal{N}$
- ▶ Clifford translations on  $S_6^2$

## Constraint varieties

## Constraint varieties

- ▶ a constraint that removes one degree of freedom maps to a hyper-surface in  $\mathbb{P}^7$

## Constraint varieties

- ▶ a constraint that removes one degree of freedom maps to a hyper-surface in  $\mathbb{P}^7$
- ▶ a set of constraints corresponds to a set of polynomial equations

## Global Kinematics - Methods: Derivation of constraint equations

Three methods:

- ▶ Geometric constraint equations
- ▶ Elimination method
- ▶ Linear implicitization algorithm

## Global Kinematics - Methods: Derivation of constraint equations

Three methods:

- ▶ Geometric constraint equations
- ▶ Elimination method
- ▶ Linear implicitization algorithm

1. Constraint equations are algebraic equations as long as no helical joint is in the mechanism
2. Derive at first the constraint equations for a canonical chain (= best adapted coordinate systems to base and end effector)
3. Change of frames is linear in algebraic (dual quaternion) parameters

# 1. Geometric constraint equations

For simple chains

## 1. Geometric constraint equations

For simple chains

Abbildung: 3-RPS parallel robot

each leg has two constraints:

1. plane constraint
2. distance constraint

## 1. Geometric constraint equations

For simple chains

Abbildung: 3-RPS parallel robot

each leg has two constraints:

1. plane constraint
2. distance constraint

three legs  $\rightarrow$  6 equations (6 polynomials) = complete description of the manipulator

## 1. Geometric constraint equations

For simple chains

Abbildung: 3-RPS parallel robot

each leg has two constraints:

1. plane constraint
2. distance constraint

three legs  $\rightarrow$  6 equations (6 polynomials) = complete description of the manipulator

This method was used 20 years ago to derive the constraint equations of the Stewart Gough platform and solve the DK

## 2. Elimination method

Write the forward kinematics and eliminate the motion parameters

## 2. Elimination method

Write the forward kinematics and eliminate the motion parameters

also only for simple chains recommended (because of the introduction of projection roots)

## 2. Elimination method

Write the forward kinematics and eliminate the motion parameters

also only for simple chains recommended (because of the introduction of projection roots)

$m$  ... number of equations to be expected:

$n$  ... DoF of the chain

$$m = 6 - n$$

## 2. Elimination method

Write the forward kinematics and eliminate the motion parameters

also only for simple chains recommended (because of the introduction of projection roots)

$m$  ... number of equations to be expected:

$n$  ... DoF of the chain

$$m = 6 - n$$

Example:

3-R chain  $\rightarrow$  3 constraint equations describing a 3-dim geometric object sitting on the Study quadric (incomplete!!)

### 3. Linear implicitization algorithm

D. R. Walter and M. L. H. On Implicitization of Kinematic Constraint Equations.  
Machine Design Research, 26:218-226,2010

Most sophisticated but complete!

### 3. Linear implicitization algorithm

D. R. Walter and M. L. H. On Implicitization of Kinematic Constraint Equations.  
Machine Design Research, 26:218-226,2010

Most sophisticated but complete!

Basic idea:

- ▶ If one has an implicit representation of a geometric object and a parametric expression, then the parametric expression must fulfill the implicit equation.
- ▶ The constraint equation must be an algebraic equation of a certain degree
- ▶ Substitution of the parametric equation into a general polynomial of a degree  $n$  yields an (overdetermined) set of linear equations in the coefficients of the implicit equation.

### 3. Linear implicitization algorithm

D. R. Walter and M. L. H. On Implicitization of Kinematic Constraint Equations.  
Machine Design Research, 26:218-226,2010

Most sophisticated but complete!

Basic idea:

- ▶ If one has an implicit representation of a geometric object and a parametric expression, then the parametric expression must fulfill the implicit equation.
- ▶ The constraint equation must be an algebraic equation of a certain degree
- ▶ Substitution of the parametric equation into a general polynomial of a degree  $n$  yields an (overdetermined) set of linear equations in the coefficients of the implicit equation.

Example:

The complete description of a 3-R chain needs 9 equations.

What can be done with implicit constraint equations????

- ▶ Complete solution of forward and inverse kinematics of arbitrary combinations of kinematic chains

What can be done with implicit constraint equations????

- ▶ Complete solution of forward and inverse kinematics of arbitrary combinations of kinematic chains
- ▶ Global description of all singularities (input and output)

What can be done with implicit constraint equations????

- ▶ Complete solution of forward and inverse kinematics of arbitrary combinations of kinematic chains
- ▶ Global description of all singularities (input and output)
- ▶ Computation of the degree of freedom of a kinematic chain or a combination of kinematic chains.

What can be done with implicit constraint equations????

- ▶ Complete solution of forward and inverse kinematics of arbitrary combinations of kinematic chains
- ▶ Global description of all singularities (input and output)
- ▶ Computation of the degree of freedom of a kinematic chain or a combination of kinematic chains.
- ▶ Sometimes a complete parametrization of the workspace.

What can be done with implicit constraint equations????

- ▶ Complete solution of forward and inverse kinematics of arbitrary combinations of kinematic chains
- ▶ Global description of all singularities (input and output)
- ▶ Computation of the degree of freedom of a kinematic chain or a combination of kinematic chains.
- ▶ Sometimes a complete parametrization of the workspace.
- ▶ Identification of different operation modes

What can be done with implicit constraint equations????

- ▶ Complete solution of forward and inverse kinematics of arbitrary combinations of kinematic chains
- ▶ Global description of all singularities (input and output)
- ▶ Computation of the degree of freedom of a kinematic chain or a combination of kinematic chains.
- ▶ Sometimes a complete parametrization of the workspace.
- ▶ Identification of different operation modes
- ▶ New form of polynomial motion interpolation

## Global Singularities

Let  $V \in k^n$  be a constraint variety and let  $p = [p_0, \dots, p_7]^T$  be a point on  $V$ . The *tangent space* of  $V$  at  $p$ , denoted  $T_p(V)$ , is the variety

$$T_p(V) = \mathbf{V}(d_p(f)): f \in \mathbf{I}(V) \quad (11)$$

of linear forms of all polynomials contained in the ideal  $\mathbf{I}(V)$  in point  $p$ .

## Global Singularities

Let  $V \in k^n$  be a constraint variety and let  $p = [p_0, \dots, p_7]^T$  be a point on  $V$ . The *tangent space* of  $V$  at  $p$ , denoted  $T_p(V)$ , is the variety

$$T_p(V) = \mathbf{V}(d_p(f)): f \in \mathbf{I}(V) \quad (11)$$

of linear forms of all polynomials contained in the ideal  $\mathbf{I}(V)$  in point  $p$ .

The local degree of freedom is defined as  $\dim T_p(V)$ .

## Global Singularities

Let  $V \in k^n$  be a constraint variety and let  $p = [p_0, \dots, p_7]^T$  be a point on  $V$ . The *tangent space* of  $V$  at  $p$ , denoted  $T_p(V)$ , is the variety

$$T_p(V) = \mathbf{V}(d_p(f)): f \in \mathbf{I}(V) \quad (11)$$

of linear forms of all polynomials contained in the ideal  $\mathbf{I}(V)$  in point  $p$ .

The local degree of freedom is defined as  $\dim T_p(V)$ .

Jacobian of the set of constraint equations:

$$\mathbf{J}(f_j) = \left( \frac{\partial f_j}{\partial x_i}, \frac{\partial f_j}{\partial y_i} \right), \quad (12)$$

## Global Singularities

Let  $V \in k^n$  be a constraint variety and let  $p = [p_0, \dots, p_7]^T$  be a point on  $V$ . The *tangent space* of  $V$  at  $p$ , denoted  $T_p(V)$ , is the variety

$$T_p(V) = \mathbf{V}(d_p(f)): f \in \mathbf{I}(V) \quad (11)$$

of linear forms of all polynomials contained in the ideal  $\mathbf{I}(V)$  in point  $p$ .

The local degree of freedom is defined as  $\dim T_p(V)$ .

Jacobian of the set of constraint equations:

$$\mathbf{J}(f_j) = \left( \frac{\partial f_j}{\partial x_i}, \frac{\partial f_j}{\partial y_i} \right), \quad (12)$$

the manipulator is in a singular pose:

$$S : \det \mathbf{J} = 0$$

yields the global singularity variety

## Constraint equations of inverted kinematic chains

- ▶ What happens to the constraint equations when the manipulator is upside down??
- ▶ Change of platform and base!!

## Constraint equations of inverted kinematic chains

- ▶ What happens to the constraint equations when the manipulator is upside down??
- ▶ Change of platform and base!!
- ▶ Quaternion conjugation!!

## Conjugation - invariant objects

Line  $v$  and 5-dim. Subspace  $w$  in  $\mathbb{P}^7$

$$v = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} t + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} s, \quad w = \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} t_1 + \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} t_2 + \dots + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 1 \end{bmatrix} t_6,$$

with  $t, s, t_1, t_2, \dots, t_6 \in \mathbb{R}$

- ▶ Inverting a constraint  $\rightarrow$  projective transformation in the image space
- ▶ topology of the objects is invariant
- ▶ rulings of  $\mathcal{Y}$  are interchanged  $\rightarrow$  "chirality" in kinematics
- ▶ geometric constraints dualize

Cardan Motion (Trammel-, Elliptic- motion)  $\leftrightarrow$  Oldham motion

# Operation Modes - Ideal Decomposition

Example: 3-UPU-Parallel Manipulator

Abbildung: 3-UPU-Model

Abbildung: 3-UPU-manipulator

Six constraint equations

1. 3 (quadratic) sphere constraint equations  $g_1 - g_3$
2. 3 (bilinear) plane constraint equations  $g_4 - g_6$

$$g_4 : 4 x_1 y_1 + x_2 y_2 + \sqrt{3} x_2 y_3 + \sqrt{3} x_3 y_2 + 3 x_3 y_3 = 0 \quad (13)$$

$$g_5 : 4 x_1 y_1 + x_2 y_2 - \sqrt{3} x_2 y_3 - \sqrt{3} x_3 y_2 + 3 x_3 y_3 = 0 \quad (14)$$

$$g_6 : x_1 y_1 + x_2 y_2 = 0 \quad (15)$$

the subsystem  $\mathcal{J} = \langle g_4, g_5, g_6, g_7 \rangle$  is independent of the design parameters splits into 10 subsystems

$$\begin{aligned}\mathcal{J}_1 &= \langle y_0, y_1, y_2, y_3 \rangle, \quad \mathcal{J}_2 = \langle x_0, y_1, y_2, y_3 \rangle, \quad \mathcal{J}_3 = \langle y_0, x_1, y_2, y_3 \rangle, \quad \mathcal{J}_4 = \langle x_0, x_1, y_2, y_3 \rangle, \\ \mathcal{J}_5 &= \langle y_0, y_1, x_2, x_3 \rangle, \quad \mathcal{J}_6 = \langle x_0, y_1, x_2, x_3 \rangle, \quad \mathcal{J}_7 = \langle y_0, x_1, x_2, x_3 \rangle, \\ \mathcal{J}_8 &= \langle x_2 - i x_3, y_2 + i y_3, x_0 y_0 + x_3 y_3, x_1 y_1 + x_3 y_3 \rangle, \\ \mathcal{J}_9 &= \langle x_2 + i x_3, y_2 - i y_3, x_0 y_0 + x_3 y_3, x_1 y_1 + x_3 y_3 \rangle, \\ \mathcal{J}_{10} &= \langle x_0, x_1, x_2, x_3 \rangle.\end{aligned}$$

- ▶ Manipulator with the same actuator lengths has 72 solutions of the direct kinematics.
- ▶ Manipulator with different actuator lengths has 78 solutions of the direct kinematics.

Relations between the different components, which relate to different operation modes of the manipulator

	$\mathcal{K}_1$	$\mathcal{K}_2$	$\mathcal{K}_3$	$\mathcal{K}_4$	$\mathcal{K}_5$	$\mathcal{K}_6$	$\mathcal{K}_7$

*exceptional three space*

$$x_0 = x_1 = x_2 = x_3 = 0$$

$$\kappa^{-1} : P^7 \setminus E \rightarrow SE(3)$$

“*extended kinematic mapping*”

what is the set of points in  $P^7$  which have the same image under  $\kappa^{-1}$ ????

$$\kappa^{-1} : P^7 \setminus E \rightarrow SE(3)$$

“*extended kinematic mapping*”

what is the set of points in  $P^7$  which have the same image under  $\kappa^{-1}$ ????

$$\mathbf{M}(\mathbf{a}) = \mathbf{M}(\mathbf{b}) \tag{19}$$

$$\{\mathbf{a} + \lambda(0, 0, 0, 0, a_0, a_1, a_2, a_3) \mid \lambda \in \mathbb{R}\}.$$

$$\kappa^{-1}: P^7 \setminus E \rightarrow SE(3)$$

“extended kinematic mapping”

what is the set of points in  $P^7$  which have the same image under  $\kappa^{-1}$ ????

$$\mathbf{M}(\mathbf{a}) = \mathbf{M}(\mathbf{b}) \tag{19}$$

$$\{\mathbf{a} + \lambda(0, 0, 0, 0, a_0, a_1, a_2, a_3) \mid \lambda \in \mathbb{R}\}.$$

## Theorem

The fiber of point  $\mathbf{a} = [a_0, \dots, a_7] \in P^7 \setminus E$  with respect to the extended inverse kinematic map  $\kappa^{-1}$  is a straight line through  $\mathbf{a}$  that intersects the exceptional generator  $E$  in  $[0, 0, 0, 0, a_0, \dots, a_3]$ .

$$\kappa^{-1}: P^7 \setminus E \rightarrow SE(3)$$

“extended kinematic mapping”

what is the set of points in  $P^7$  which have the same image under  $\kappa^{-1}$ ????

$$\mathbf{M}(\mathbf{a}) = \mathbf{M}(\mathbf{b}) \tag{19}$$

$$\{\mathbf{a} + \lambda(0, 0, 0, 0, a_0, a_1, a_2, a_3) \mid \lambda \in \mathbb{R}\}.$$

## Theorem

The fiber of point  $\mathbf{a} = [a_0, \dots, a_7] \in P^7 \setminus E$  with respect to the extended inverse kinematic map  $\kappa^{-1}$  is a straight line through  $\mathbf{a}$  that intersects the exceptional generator  $E$  in  $[0, 0, 0, 0, a_0, \dots, a_3]$ .

Properties of  $\kappa^{-1}$

- ▶  $\kappa^{-1}$  is quadratic, the degree of trajectories is at most twice the degree of the interpolant in  $P^7$
- ▶ one can achieve a geometric continuity of order  $n$  for the motion with trajectories of degree  $2(n+1)$
- ▶ At possible intersection points of interpolant and exceptional generator  $E$ , the map  $\kappa^{-1}$  becomes singular and a degree reduction of the trajectories occurs

## Cable driven parallel manipulators

## Cable driven parallel manipulators

## Cable driven parallel manipulators

Much more complicated than DK Stewart-Gough platform

DK solutions for cable configuration

Number of cables	2	3	4	5
Number of solutions over $\mathbb{C}$	24	156	216	140

Numbers are due to additional equilibrium constraints!

Thanks for your attention!
